

Examples Project
Project Rollup Review

Planned Review Date: February 25/2009

Communcation Channel:

news.eclipse.org/eclipse.technology.examples

Wayne Beaton, The Eclipse Foundation

Introduction

The Eclipse Examples Project (Examples) provides a location for adopters of Eclipse technology to find well-documented example applications, platforms, and features/plugin-ins/bundles that demonstrate the use of Eclipse technology

Project Rollup

- Currently, the Examples Project is a container project with several operational projects/subcomponents
 - Ebert
 - Sudoku
 - ImageUtils
- We'd like to roll these operational projects into the parent

Rationale

- Given this current structure, creating new examples requires the creation of a new component/sub-project
 - Proposal, creation review, provisioning, ...
- We don't need a sub-project for each example
 - Relatively small set of committers
 - All “Examples” committers work on all examples
 - No need for distinct UNIX groups to manage write access

Final Form

- Examples project has single UNIX group
- Single update site for all examples
- Single download site for all examples
- Each example has:
 - Its own directory in the CVS repository
 - Its own Bugzilla component
 - Its own page on the Examples Project website
